

OLIST E-COMMERCE CAPSTONE PROJECT

Customer Satisfaction & Delivery Performance

Understanding how delivery performance shapes customer reviews on Brazil's Olist marketplace, and what it means for retention.

Chidiogo Joyce Ezeugwu · ezeugwuchidiogo@gmail.com

BUSINESS CONTEXT

Delivery Is One of the Most Visible Parts of the Customer Journey

About Olist

Olist is one of Brazil's largest e-commerce platforms, connecting thousands of sellers with customers across the country. As the company grows, **maintaining a positive customer experience** has become increasingly important.

Why It Matters

Customer satisfaction drives loyalty, repeat purchases, and long-term growth. Delivery is one of the most visible parts of the customer journey, making its impact on satisfaction critical to understand.

The Goal

To understand how delivery outcomes influence customer reviews, and to uncover actionable insights for improving customer satisfaction.

PROJECT OBJECTIVES

Three Questions Guided This Analysis

01

How satisfied are customers overall?

02

How does delivery performance relate to customer reviews?

03

What can be done to improve customer satisfaction?

KEY FINDING

Most Customers Are Satisfied, but Low Ratings Remain Significant

99,224 REVIEWS ANALYZED

One-star reviews are the largest single group among low ratings, 11,424 compared with 3,151 two-star reviews, pointing to a meaningful pocket of highly dissatisfied customers.

KEY FINDING

Late Deliveries Are the Strongest Driver of Dissatisfaction

62.40%

of late deliveries received 1–2 star ratings

11.39%

of on-time/early deliveries received 1–2 star ratings

Customers experiencing late deliveries were over 5× more likely to leave a poor review.

Average review score: 4.21 (on-time/early) vs. 2.27 (late)

Source: Olist order reviews, cross-referenced with delivery status

KEY FINDING

Customer Satisfaction Declines as Delays Become More Severe

STEEPEST DROP: 3.29 → 1.68

Average review scores decline sharply once delays exceed three days, with the steepest drop occurring in the first week.

Satisfaction ticks back up slightly beyond 30 days late, which is worth investigating as a sign that service recovery efforts may be helping (see Recommendation 3).

Business Recommendations

01

Reduce the Frequency and Severity of Delivery Delays

Delayed orders are strongly linked to dissatisfaction, 62.40% of late deliveries received 1–2 star ratings, versus 11.39% for on-time/early orders, making delay reduction a high-leverage lever for improving overall satisfaction.

02

Prioritize Orders Experiencing Extended Delays

Customer satisfaction declines significantly once delays exceed three days. Orders showing signs of extended delay should be prioritized through closer coordination with logistics partners, sellers, and fulfillment teams, alongside proactive communication from customer service to keep affected customers informed and manage their expectations.

03

Investigate the 30+ Day Delay Segment

Satisfaction in this segment was slightly higher than the trend would predict. It is worth investigating whether customer service, operational, or seller-led interventions were applied here, and if so, whether those practices could be applied more broadly.

THE BOTTOM LINE

Delivery performance is one of the clearest levers Olist has for improving customer satisfaction, and the data shows exactly where to focus first.

Thank you.
